MODEL 3205/3206 (Revision "A")

In order to improve power-amplifier stability at high amplitudes, capacitor C34 (.05 mfd x 500 v, P/N 14-765) has been added between B+ and circuit ground (shown between Q6 and R33 on schematic).

In order to improve the low frequency response, the output coupling condensers have been changed from a 250 MFD x 25V capacitor (Part No. 14-839).
